EXAMINER'S AMENDMENT

1. An Examiner's Amendment to the record appears below. Should the changes or additions be unacceptable to Applicant, an amendment may be filed as provided by 37 C.F.R. § 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the Issue Fee.

Title

2. Pursuant to M.P.E.P. §606.01, this title has respectfully been changed to read as follows:

-- IP ADDRESS OWNERSHIP VERIFICATION MECHANISM --

Claims

3. Authorization for this examiner's amendment was given by John Lastova (Reg. 33,149) on August 03, 2006.

4. Any comments Applicants considers necessary must be submitted no later than the payment of the Issue Fee and to avoid processing delays, should preferable accompany the Issue Fees. Such submission should be clearly labeled "Comments on Statement of Reasons for Allowance". In event of any post-allowance papers (e.g. IDS, 312 amendment, petition, etc.), Applicant is exhorted to mail papers to the Production Control branch in Publications or faxed to post-allowance papers correspondence branch at (703) 308-5864 to expedite issuing process or call PUB's Customer Service if any questions at (703) 305-8497.

SEE BELOW AMENDMENTS TO THE CLAIMS.

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Previously Presented) A method of operating an IP network comprising:

receiving one or more components from a host coupled to the IP network, the host having an IP address, the IP address comprising a routing prefix and an interface identifier part;

applying a one-way coding function to the or each component and/or derivatives of the or each component;

comparing a result or a derivative of the result against the interface identifier part of the IP address; and

asserting that the host is authorized to use the IP address which the host claims to own.

2. (Original) A method according to claim 1, wherein said components comprise a hash value being one of a sequence of related hash values.

3. (Original) A method according to claim 1, wherein said components comprise a public key or a digest of a public key generated by said host or obtained by said host from another authorized party or a fixed bit sequence of the same length.

4. (Original) A method according to claim 1, wherein said components comprise an initial interface identifier which corresponds to or is derived from a link layer address of the host, or a fixed bit sequence of the same length.

5. (Original) A method according to claim 1, wherein said components comprise an initial interface identifier which corresponds to or is derived from a link layer address of the host, or a zero bit sequence of the same length.

6. (Original) A method according to claim 2, wherein said components comprise a counter value which identifies the position of the received hash value in said sequence.

7. (Previously Presented) A method according to claim 2, wherein a series of hash values are derived at the host by applying a one-way coding function to a seed value and a public key or a digest of the public key.

8. (Original) A method according to claim 2, wherein said series of hash values are derived at the host by applying a one-way coding function to a seed and an initial interface identifier.

9. (Original) A method according to claim 2, wherein said series of hash values are derived at the host by applying a one-way coding function to a seed, a public key or a digest of the public key, and an initial interface identifier.

10. (Original) A method according to claim 2, and comprising deriving a hash value from the received hash value to provide a derivative to which the one-way coding function is applied, the derived hash value being the last hash value in the sequence.

11. (Original) A method according to claim 10, wherein in the event of a first IP address verification, the hash value received from the host is the hash value preceding the final hash value in the sequence and for each subsequent verification process, the next previous hash value must be received.

12-16. (Canceled)

17. (Previously Presented) A method of verifying that a host coupled to an IP network is authorised to use an IP address which the host claims to own, and that the host is able to receive data packets sent to that address, the method comprising: carrying out the method of claim 1 to confirm that said host is authorised to use the IP address; sending a challenge to the host using said IP address as the destination address for the challenge;

receiving a response from the host; and

verifying that the received response is a correct response to the challenge.

18. (Original) A method according to claim 17, wherein said challenge is a randomly generated number and the response comprises the challenge.

19. (Original) A method according to claim 17, wherein said challenge comprises said IP address concatenated with a randomly generated number, and the response comprises the IP address concatenated with the challenge.

20. (Original) A method according to claim 17, wherein said challenge is formed by applying a one-way coding function to said IP address concatenated with a randomly generated number, and the response is formed by applying a one-way coding function to the IP address concatenated with the challenge.

21-22. (Canceled)
